

ALEKSANDRA_BRAIN — Clinician Brief

Topic: Cord blood expanded access for severe HIE
For: Dr. Hien, BMC Pediatric Neurology
Rendered: 2026-05-16T23:51:14+00:00
Patient context version: 74b5a152b37a (last updated 2026-05-16)

Patient context (this version)

Identity	A.J., 8-month-old infant with severe HIE
Age band	0-12 months (neuroplasticity window)
Diagnosis	Severe hypoxic-ischemic encephalopathy with diffuse cystic encephalomalacia. Brainstem preserved. Received
Location	U.S. East Coast (family-controlled detail)
Active programs	Duke EAP cord blood (vigabatrin washout window); Wisconsin Virtual A2; BMC primary care + neurology

Originating agent runs

Findings (claim → citations)

#	Claim	Citations	Grade	Conf
1	Three preclinical studies and one phase-I trial report neuroprotective effects of 100mg/kg 10% 0.000001 infusion in neonatal HIE.	PMID:000001005-0000001	2	0.82
2	Two cohort series describe vigabatrin washout windows compatible with 0.000002 timing.	PMID:000002	3	0.65

Citation appendix

Each row shows the citation id, source type, retrieval timestamp, and (where available) the source URL. The clinician can verify any claim by following the citation independently.

#	Citation	Source type	Retrieved	URL
1	NCT:00000001	ctgov	2026-05-16T10:00:00Z	https://clinicaltrials.gov/study/NCT00000001
